U.S. Patent and Trademark Office PTOL-326 (Rev. 04-01)

Art Unit: 2681

s, ,

DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 1. Claims 1-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Losey (U.S. patent number 6,606,492) in view of Burges (U.S. patent number 6,031,465).

Regarding claims 1, 8-10, Losey discloses essentially all the claimed invention as set fourth in the instant application, further Losey discloses a keyless entry system. In addition Losey discloses transmitting data for a security device, in particular for access authorization systems and/or driving authorization systems of a motor vehicle comprising the steps of transmitting (which reads on the passive signaling device 22 includes a transmitter that provides an authentication signal to a system controller 24 without requiring any manual activation by the user disclosed column 2 lines 38-40) data is transmitted over the air (which reads on a keyless entry system having a passive signaling device disclosed column 1 lines 13-15) from a transmitter unit (22) to a receiver unit (which reads on column 2 lines 3-6), wherein, after capacitive coupling of the transmitter unit and receiver unit (which reads on column 3 lines 1-10), however, Losey fails to specifically discloses the use of data is transmitted from the transmitter to the receiver using a signal which is generated by a capacitive alternating field.

In the same field of endeavor, Burgess discloses a keyless entry system for vehicles in particular. In addition Burgess discloses the use of data is transmitted from the transmitter to the

Art Unit: 2681

receiver using a signal which is generated by a capacitive alternating field (which reads on rolling codes as disclosed in column 5 lines 9-11).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to improve Losey by modifying the keyless entry system as taught by Burgess for the purpose of reducing overall system complexity.

Regarding claims 2, Losey discloses everything claimed as applied above (see claim 1) however, Losey fails to specifically discloses the use of after reception of the signal, a transmitter transmits an encoded information item to the receiver on a second wireless transmission link, which information item is compared with a predefined encoded information item in the receiver, and when said items correspond, a drive signal for the security device is output.

In the same field of endeavor, Burgess discloses a keyless entry system for vehicles in particular. In addition Burgess discloses after reception of the signal, a transmitter transmits an encoded information item to the receiver on a second wireless transmission link, which information item is compared with a predefined encoded encoded information item in the receiver, and when said items correspond, a drive signal for the security device is output (which reads on column 7 lines 65-67 and column 8 lines 1-2).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to improve Losey by modifying the keyless entry system with the use of after reception of the signal, a transmitter transmits an encoded information item to the receiver on a second wireless transmission link, which information item is compared with a

Art Unit: 2681

predefined encoded encoded information item in the receiver, and when said items correspond, a drive signal for the security device is output as taught by Burgess for the purpose of reducing overall system complexity.

Regarding claim 3, Losey discloses everything claimed, as applied above (see claim 1) additionally, Losey discloses the second transmission link for the encoded information item is implemented by inductive coupling or radio coupling (which reads on column 3 lines 13-18).

Regarding claims 4-6, Losey discloses everything claimed, as applied above (see claim 1) additionally, Losey discloses A system for activating and/or deactivating a security device, in particular for access authorization systems and/or driving authorization systems of a motor vehicle (which reads on column 1 lines 65-67 and column 2 lines 1-5), in which an encoded information item is transmitted over the air between a portable transmitter and a receiver (which reads on a keyless entry system having a passive signaling device disclosed column 1 lines 13-15), however, Losey fails to specifically discloses the use of the receiver comparing the received information item with a predefined encoded information item, and outputting a drive signal to the security device when these said two information items correspond, wherein the receiver has a capacitive transmitter unit which generates a start signal by means of a capacitive alternating field and transmits it to the receiver unit of the transmitter.

In the same field of endeavor, Burgess discloses a keyless entry system for vehicles in particular. In addition Burgess discloses the use of the receiver comparing the received information item with a predefined encoded information item (which reads on column 7 lines 65-67 and column 8 lines 1-3), and outputting a drive signal to the security device when these said two information items correspond, wherein the receiver has a capacitive transmitter unit which

Art Unit: 2681

generates a start signal by means of a capacitive alternating field and transmits it to the receiver unit of the transmitter (which reads on rolling codes as disclosed in column 5 lines 9-11).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to improve Losey by modifying the keyless entry system with the use of the receiver comparing the received information item with a predefined encoded information item, and outputting a drive signal to the security device when these said two information items correspond, wherein the receiver has a capacitive transmitter unit which generates a start signal by means of a capacitive alternating field and transmits it to the receiver unit of the transmitter as taught by Burgess for the purpose of reducing overall system complexity.

Regarding claims 7,11, Losey discloses everything claimed as applied above (see claim 1) however, Losey fails to specifically discloses the use of the encoded information item is modulated onto a high_frequency carrier frequency which is generated by the alternating current generator.

In the same field of endeavor, Burgess discloses a keyless entry system for vehicles in particular. In addition Burgess discloses the use of the encoded information item (3) is modulated onto a high_frequency carrier frequency (which reads on rolling codes as disclosed in column 3 lines 35-38) which is generated by [the] alternating current generator (which reads on rolling codes as disclosed in column 5 lines 9-11).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to improve Losey by modifying the keyless entry system with the use of the receiver comparing the received information item with a predefined encoded information item, and outputting a drive signal to the security device when these said two information items

Art Unit: 2681

Page 6

correspond, wherein the receiver has a capacitive transmitter unit which generates a start signal by means of a capacitive alternating field and transmits it to the receiver unit of the transmitter as taught by Burgess for the purpose of reducing overall system complexity.

Citation of Pertinent Prior Art

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Raith (U. S. Patent Number 5,241,598) discloses rolling key resynchronization in cellular verification system;

Art Unit: 2681

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sheila B. Smith whose telephone number is (703)305-0104. The examiner can normally be reached on Monday-Thursday 6:00 am - 3:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Sinh Tran can be reached on 703-305-4040. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703)305-0104.

S. Smith
